

One capture desk. Every module writes to it.

Winroom is a working government-RFP workspace: sign in, keep a capability profile, find notices, ingest a solicitation, score go / no-go, draft Volume I-III, and hold artifacts — on the same desk.

What actually ships. Discovery, Intel, Analyzer, Vault, Proposals, Automation, Workflows, Connectors, Analytics, Team, Settings. OpenAI is optional for copilot and volume polish.

MOTIVE

Capture was split across five tools.

The desk exists so a lead can discover, decide, and start a volume in one login — not SAM.gov, Word, inbox, a spreadsheet, and a CRM tab.

01 Find

Notices live outside the desk. Fit vs NAICS is a memory exercise.

02 Decide

Go / no-go happens in a meeting and never lands on the record.

03 Draft

Word starts blank. CRM is a separate, late push.

WHY IT WAS BUILT

Friction on one side. The desk on the other.

Out in the market

SAM.gov, Word, inbox, CRM — none share a record.

Shalls with no owner or status.

Go / no-go as a meeting, not a saved score.

Drafts that start blank after the clock starts.

Inside Winroom

In-desk SAM-style board, matched to NAICS and keywords.

Analyzer: Document, Matrix, Decision, Proposal.

Go / no-go from profile, matrix gaps, bidders, set-aside.

Volume I-III templates saved into Vault.

BUSINESS VALUE

The client bought a desk that actually runs.

One capture record

Agency, NAICS, value, due date, status, and win probability sit on the bid the team opens.

A decision you can reopen

Go / conditional / no-go is scored from NAICS, keywords, matrix gaps, bidders, and set-aside — then stored.

Writers begin in structure

Volume I technical, Volume II past performance, Volume III price. Model polish only if a key is set.

The cell stays on one workspace

Alerts, roster, Pilot / Desk / Enterprise plans, and in-desk connector sync — not a live CRM contract.

USER JOURNEY

Login to volume — on one RFP.

The path a capture lead actually takes on this desk. In-desk discovery, not a live SAM.gov API.

01 Discover or ingest

Run the in-desk feed, or paste a URL / solicitation text on Intel.

02 Matrix

Paste builds the document; shall-like lines get owner and status.

03 Score

Go / conditional / no-go against the capability profile.

04 Draft

Copilot on the open bid. Volume I-III land in Vault.

05 Operate

Deadline alerts, auto-analyze, in-desk CRM / Slack tag, team.

AI LAYER

AI where it helps. Rules where it must.

Chat

Copilot on the open bid. gpt-4o-mini when a key is set; otherwise a local briefing from stored cover facts.

Write

Volume I-III start as templates. Model polish is additive. No key: the structured draft still lands in Vault.

Score

Not a model call. NAICS, keywords, matrix gaps, bidders, set-aside, win probability — then saved.

Automate

Four agents: in-desk discovery, deadline alerts, auto-analyze (matrix + score), CRM tag on a connected connector.

Cookie login. Server-backed workspace. Optional OpenAI. Discovery is an in-desk SAM-style feed — not a live SAM.gov API. Connector sync tags bids on the desk — it does not call Salesforce or HubSpot. No image generation.

THE FULL PICTURE

What you log into is the product.

Winroom is a working capture desk, not a slide. One cookie session. One server-backed workspace. Every module below writes that same record.

Capture path

Set NAICS and keywords. Run in-desk discovery or paste a URL / solicitation on Intel. Analyzer holds document, matrix, go / no-go, and Volume I-III.

What keeps running

Four agents post alerts, score new bids, and tag a connected CRM / Slack target on the desk. OpenAI is optional. Scoring is rules, not a model.

What it is not

Not a live SAM.gov API. Not a live Salesforce or HubSpot contract. Not image generation. The desk still moves the bid from notice to vault.
